What if my roof is not suitable for solar?

If a solar professional determines that your roof is not suitable for solar, or you don't own your home, you can still benefit from solar energy. Community solar allows multiple people to benefit from a single, shared solar array that can be installed on- or off-site.

Can solar panels be installed on flat ground?

Certain solar markets, like Florida, have naturally level land, which makes installs simpler, but flat terrain isn't always an option. Solar sites in the Northeast, mountain states or hilly regions can undergo civil engineering to make level ground for mounting.

Do I need a structural assessment before installing solar panels?

Before mounting solar panels, your roof must undergo a thorough structural assessment. Solar panels and mounting equipment add approximately 3-4 pounds per square foot of additional load to your roof structure. Key evaluation factors include: If your roof needs replacement, complete this work before solar installation.

Can solar panels be installed on a roof?

Solar panels are built to work in all climates, but in some cases, rooftops may not be suitable for solar systems due to age or tree cover. If there are trees near your home that create excessive shade on your roof, rooftop panels may not be the most ideal option. The size, shape, and slope of your roof are also important factors to consider.

In high-altitude environments, installing solar photovoltaic panels involves unique challenges and techniques that differ significantly from installations performed in flat terrains.
