How do Idu and ODU work together?

The IDU and ODU work together seamlessly to provide reliable satellite communication services. Explore the key differences between Indoor Units (IDU) and Outdoor Units (ODU) in VSAT systems.

What is an outdoor unit (ODU)?

ODU stands for Outdoor Unit. It comprises the VSAT components installed outside the building. The ODU typically consists of: Here's what each component does: RF Upconverter/Downconverter: The upconverter converts the modulated IF signal to a Radio Frequency (RF) signal based on the band (C band, Ku band, etc.).

What is an ODU satellite dish?

It's this. It's a satellite dish. ODU is AT&T's acronym for Outdoor Unit. They've been using this term for decades, long before AT&T took over DIRECTV. They're not the only one. It's a common enough term in the industry, so common that you don't tend to think about why it's ODU and not just OU which you sort of think it ought to be.

What is an ODU & how does it work?

Specifically, an ODU consists of the following items, all assembled so that everything works: LNB (Low Noise (amplifier)/Block (downconverter): The part that receives the signals, out in front. Put them all together and you have a working ODU. An ODU can also contain a multiswitch, which lets more than one receiver share the signals.
