-----

Solar energy fluctuations are solved by dried coal storage. High thermal and economic performances are achieved. A new solar-aided power generation system is proposed. It is based on ...

Together they are working to eliminate the use of water in cooling concentrated solar power (CSP) plants and minimising the lifetime cost of dry cooling systems.

This work demonstrates the promise of physics-based simulation and optimization to accelerate the design of renewable power technologies like concentrated solar power.

These moisture-activated generators (or MEGs) work by creating a flow of ions--charged particles--inside a special gel, generating power naturally. But current versions face ...

A team of students from Nigeria, Peru, and India has designed a system that combines solar power and a biomass generator to help small-scale farmers efficiently dry crops such as cocoa ...

Therefore, the aim of this study is to investigate the techno-economic competitiveness of deploying both modes of cooling (wet and dry) in two different parabolic trough solar thermal power...

Dry coolers play a vital role in the efficient operation of solar power plant cooling systems. By using air as a coolant, they eliminate the need for water, making them a more sustainable and ...

Many types of power plants generate electricity by boiling water to produce steam, which is then passed through a turbine. Plants that burn coal and biomass, nuclear plants, some natural ...

Using this simulator, we leverage recent results in high-dimensional Bayesian optimization to optimize dry cooler designs that minimize lifetime cost for a given location, reducing this cost by...
