-----

A wind turbine can be made to slow down by increasing the electrical load (resistance) connected to the turbine's generator. This is called electromagnetic braking, and is usually the first ...

The blade that snapped off an offshore turbine at the Vineyard Wind project in Massachusetts on July 13 broke due to a manufacturing defect, according to GE Vernova, the turbine ...

In general, reactive power regulation required from wind turbine generators are based on wind farm (WF)/wind turbine capacity, grid voltage level and grid stiffness.

In the 1920's wind turbines were made with blades similar to that of airplane propellers and were easier to construct because of their much smaller size and were able to produce around 3 kilowatts of ...

The most frequent cause of wires becoming detached from the KidWind Wind Turbine Generator with Wires (KW-GEN3) is stress on the connection. Repeated bending of the wire at the ...

I'm trying to figure out why I'm not getting any power from my wind generator. My settlement NEVER gets any power from it, apparently. But it seems to be working fine. Most of the ...

Within hours of fiberglass from a broken offshore wind turbine washing ashore on Nantucket, clean energy and anti-wind advocates jumped on the story, and two competing ...

The blade that snapped off an offshore turbine at the Vineyard ...

For small wind turbines, they don't have mechanical breaks and depend on the resistance from the load to keep the rotation speed down. (I have always wondered if that is really enough for all ...

On Saturday, July 13, a newly installed turbine at the Vineyard Wind farm started undergoing routine testing before it could send power to the grid. It had been operating for six hours ...

## Why did the wind knife generator stop

In some wind generators other than Rutland/Marlec, this resonance/fluttering of the blade ends causes extra noise even at design speeds and some replacement blades have been designed ...
